## ✓ SpaceX Falcon 9 First Stage Landing Prediction

### ✓ Hands-on Lab: Complete the EDA with Visualization

Estimated time needed: **70** minutes

In this assignment, we will predict if the Falcon 9 first stage will land successfully. SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is due to the fact that SpaceX can reuse the first stage.

In this lab, you will perform Exploratory Data Analysis and Feature Engineering.

Falcon 9 first stage will land successfully

Several examples of an unsuccessful landing are shown here:

Most unsuccessful landings are planned. Space X performs a controlled landing in the oceans.

### ✓ Objectives

Perform exploratory Data Analysis and Feature Engineering using `Pandas` and `Matplotlib`

- Exploratory Data Analysis
- Preparing Data Feature Engineering

Install the below libraries

```
1 !pip install pandas
2 !pip install numpy
3 !pip install seaborn
4 !pip install matplotlib
```

```
Requirement already satisfied: pandas in /usr/local/lib/python3.11/dist-packages (2.2.2)
Requirement already satisfied: numpy>=1.23.2 in /usr/local/lib/python3.11/dist-packages (from pandas) (2.0.2)
Requirement already satisfied: python-dateutil>=2.8.2 in /usr/local/lib/python3.11/dist-packages (from pandas) (2.8.2)
Requirement already satisfied: pytz>=2020.1 in /usr/local/lib/python3.11/dist-packages (from pandas) (2025.1)
Requirement already satisfied: tzdata>=2022.7 in /usr/local/lib/python3.11/dist-packages (from pandas) (2025.1)
Requirement already satisfied: six>=1.5 in /usr/local/lib/python3.11/dist-packages (from python-dateutil>=2.8.2->pandas) (1.
Requirement already satisfied: numpy in /usr/local/lib/python3.11/dist-packages (2.0.2)
Requirement already satisfied: seaborn in /usr/local/lib/python3.11/dist-packages (0.13.2)

Requirement already satisfied: packaging>=20.0 in /usr/local/lib/python3.11/dist-packages (from matplotlib) (24.2)
Requirement already satisfied: pillow>=8 in /usr/local/lib/python3.11/dist-packages (from matplotlib) (11.1.0)
Requirement already satisfied: pyparsing>=2.3.1 in /usr/local/lib/python3.11/dist-packages (from matplotlib) (3.2.1)
Requirement already satisfied: python-dateutil>=2.7 in /usr/local/lib/python3.11/dist-packages (from matplotlib) (2.8.2)
Requirement already satisfied: six>=1.5 in /usr/local/lib/python3.11/dist-packages (from python-dateutil>=2.7->matplotlib) (1.3.1)
```

## ✓ Import Libraries and Define Auxiliary Functions

We will import the following libraries the lab

```
1 # andas is a software library written for the Python programming language for data manipulation and analysis.
2 import pandas as pd
3 #NumPy is a library for the Python programming language, adding support for large, multi-dimensional arrays and matrices, al
4 import numpy as np
5 # Matplotlib is a plotting library for python and pyplot gives us a MatLab like plotting framework. We will use this in our
6 import matplotlib.pyplot as plt
7 #Seaborn is a Python data visualization library based on matplotlib. It provides a high-level interface for drawing attracti
8 import seaborn as sns
```

## ✓ Exploratory Data Analysis

First, let's read the SpaceX dataset into a Pandas dataframe and print its summary

```
1 df=pd.read_csv("https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DS0321EN-SkillsNetwork/datasets/datas
2
3 # If you were unable to complete the previous lab correctly you can uncomment and load this csv
4
5 # df = pd.read_csv('https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkillsNetwork-DS0701EN-Sk
6
7 df.head(5)
```

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	GridFins	Reused	Legs	LandingPad	BL
0	1	2010-06-04	Falcon 9	6104.959412	LEO	CCAFS SLC 40	None None	1	False	False	False	NaN	
1	2	2012-05-22	Falcon 9	525.000000	LEO	CCAFS SLC 40	None None	1	False	False	False	NaN	
2	3	2013-03-01	Falcon 9	677.000000	ISS	CCAFS SLC 40	None None	1	False	False	False	NaN	

First, let's try to see how the FlightNumber (indicating the continuous launch attempts.) and Payload variables would affect the launch outcome.

We can plot out the FlightNumber vs. PayloadMass and overlay the outcome of the launch. We see that as the flight number increases, the first stage is more likely to land successfully. The payload mass is also important; it seems the more massive the payload, the less likely the first stage will return.

```
1 sns.catplot(y="PayloadMass", x="FlightNumber", hue="Class", data=df, aspect = 5)
2 plt.xlabel("Flight Number",fontsize=20)
3 plt.ylabel("Pay load Mass (kg)",fontsize=20)
4 plt.show()
```

Next, let's drill down to each site visualize its detailed launch records.

## ✓ TASK 1: Visualize the relationship between Flight Number and Launch Site

Use the function catplot to plot FlightNumber vs LaunchSite, set the parameter x parameter to FlightNumber, set the y to Launch Site and set the parameter hue to 'class'

```
1 # Plot a scatter point chart with x axis to be Flight Number and y axis to be the launch site, and hue to be the class value
2 plt.figure(figsize=(12, 6))
3 sns.catplot(x='FlightNumber', y='LaunchSite', hue='Class', data=df, aspect=2.5, height=5)
4 plt.title('Relationship between Flight Number and Launch Site')
5 plt.tight_layout()
6 plt.savefig('task1_flight_vs_site.png')
7 plt.show()
8 plt.close()
```

&lt;Figure size 1200x600 with 0 Axes&gt;

Now try to explain the patterns you found in the Flight Number vs. Launch Site scatter point plots.

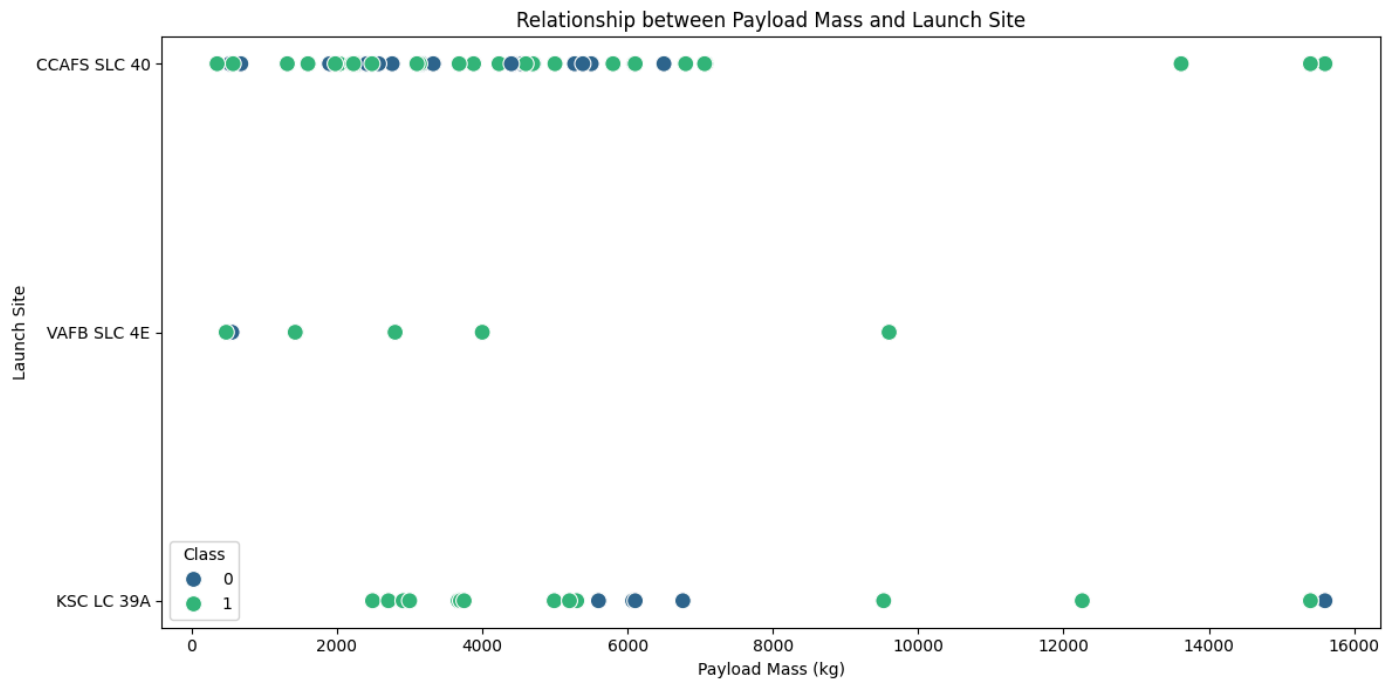

## ✓ TASK 2: Visualize the relationship between Payload and Launch Site

We also want to observe if there is any relationship between launch sites and their payload mass.

```

1 # Plot a scatter point chart with x axis to be Pay Load Mass (kg) and y axis to be the launch site, and hue to be the class
2 plt.figure(figsize=(12, 6))
3 sns.scatterplot(x='PayloadMass', y='LaunchSite', hue='Class', data=df, palette='viridis', s=100)
4 plt.title('Relationship between Payload Mass and Launch Site')
5 plt.xlabel('Payload Mass (kg)')
6 plt.ylabel('Launch Site')
7 plt.tight_layout()
8 plt.savefig('task2_payload_vs_site.png')
9 plt.show()
10 plt.close()

```

Now if you observe Payload Vs. Launch Site scatter point chart you will find for the VAFB-SLC launchsite there are no rockets launched for heavypayload mass(greater than 10000).

Haz doble clic (o ingresa) para editar

### ✓ TASK 3: Visualize the relationship between success rate of each orbit type

Next, we want to visually check if there are any relationship between success rate and orbit type.

Let's create a bar chart for the success rate of each orbit

```
1 # HINT use groupby method on Orbit column and get the mean of Class column
2 orbit_success = df.groupby('Orbit')['Class'].mean().reset_index()
3 orbit_success.columns = ['Orbit', 'Success Rate']
4 plt.figure(figsize=(12, 6))
5 sns.barplot(x='Orbit', y='Success Rate', data=orbit_success, palette='Blues')
6 plt.title('Success Rate by Orbit Type')
7 plt.xticks(rotation=45)
8 plt.tight_layout()
9 plt.savefig('task3_orbit_success.png')
10 plt.show()
11 plt.close()
```

 <ipython-input-9-83d3f2e0a8bf>:5: FutureWarning:

Passing `palette` without assigning `hue` is deprecated and will be removed in v0.14.0. Assign the `x` variable to `hue` and

```
sns.barplot(x='Orbit', y='Success Rate', data=orbit_success, palette='Blues')
```

Analyze the plotted bar chart try to find which orbits have high sucess rate.

#### ✓ TASK 4: Visualize the relationship between FlightNumber and Orbit type

For each orbit, we want to see if there is any relationship between FlightNumber and Orbit type.

```
1 # Plot a scatter point chart with x axis to be FlightNumber and y axis to be the Orbit, and hue to be the class value
2 plt.figure(figsize=(12, 8))
3 sns.scatterplot(x='FlightNumber', y='Orbit', hue='Class', data=df, palette='viridis', s=100)
4 plt.title('Relationship between Flight Number and Orbit Type')
5 plt.xlabel('Flight Number')
6 plt.ylabel('Orbit Type')
7 plt.tight_layout()
8 plt.savefig('task4_flight_vs_orbit.png')
9 plt.show()
10 plt.close()
11
```

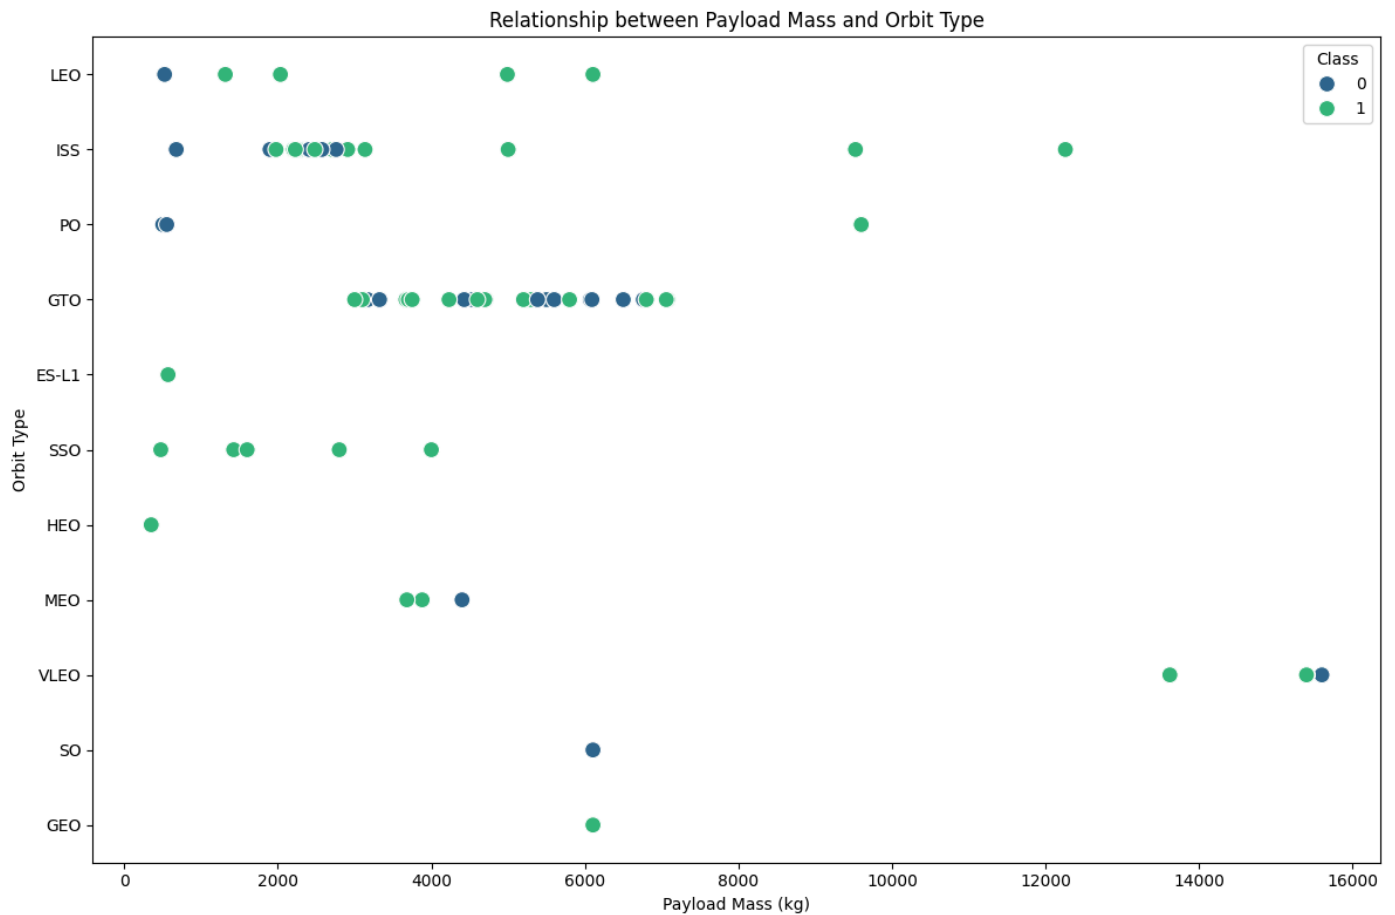

You should see that in the LEO orbit the Success appears related to the number of flights; on the other hand, there seems to be no relationship between flight number when in GTO orbit.

#### ✓ TASK 5: Visualize the relationship between Payload and Orbit type

Similarly, we can plot the Payload vs. Orbit scatter point charts to reveal the relationship between Payload and Orbit type

```
1 # Plot a scatter point chart with x axis to be Payload and y axis to be the Orbit, and hue to be the class value
2 plt.figure(figsize=(12, 8))
3 sns.scatterplot(x='PayloadMass', y='Orbit', hue='Class', data=df, palette='viridis', s=100)
4 plt.title('Relationship between Payload Mass and Orbit Type')
5 plt.xlabel('Payload Mass (kg)')
6 plt.ylabel('Orbit Type')
7 plt.tight_layout()
8 plt.savefig('task5_payload_vs_orbit.png')
9 plt.show()
10 plt.close()
```

With heavy payloads the successful landing or positive landing rate are more for Polar,LEO and ISS.

However for GTO we cannot distinguish this well as both positive landing rate and negative landing(unsuccesful mission) are both there here.

## ✓ TASK 6: Visualize the launch success yearly trend

You can plot a line chart with x axis to be Year and y axis to be average success rate, to get the average launch success trend.

The function will help you get the year from the date:

```
1 # A function to Extract years from the date
2 year=[]
3 def Extract_year(date):
4     for i in df["Date"]:
5         year.append(i.split("-")[0])
6     return year
7
```

```
1 # Plot a line chart with x axis to be the extracted year and y axis to be the success rate
2 # Add the extracted year to the dataframe
3 df['Year'] = Extract_year(df['Date'])
4
5 # Calculate the success rate per year
6 yearly_success = df.groupby('Year')['Class'].mean().reset_index()
7 yearly_success.columns = ['Year', 'Success Rate']
8
9 # Plot a line chart with x axis to be the extracted year and y axis to be the success rate
10 plt.figure(figsize=(10, 6))
```

```

11 sns.lineplot(x='Year', y='Success Rate', data=yearly_success, marker='o', linewidth=2)
12 plt.title('Launch Success Yearly Trend')
13 plt.xlabel('Year')
14 plt.ylabel('Success Rate')
15 plt.grid(True, linestyle='--', alpha=0.7)
16 plt.tight_layout()
17 plt.savefig('task6_yearly_trend.png')
18 plt.show()
19 plt.close()

```

You can observe that the success rate since 2013 kept increasing till 2017 (stable in 2014) and after 2015 it started increasing.

## ✓ Features Engineering

By now, you should obtain some preliminary insights about how each important variable would affect the success rate, we will select the features that will be used in success prediction in the future module.

```

1 features = df[['FlightNumber', 'PayloadMass', 'Orbit', 'LaunchSite', 'Flights', 'GridFins', 'Reused', 'Legs', 'LandingPad',
2 features.head()

```

	FlightNumber	PayloadMass	Orbit	LaunchSite	Flights	GridFins	Reused	Legs	LandingPad	Block	ReusedCount	Serial
0	1	6104.959412	LEO	CCAFS SLC 40	1	False	False	False	NaN	1.0	0	B0003
1	2	525.000000	LEO	CCAFS SLC 40	1	False	False	False	NaN	1.0	0	B0005
2	3	677.000000	ISS	CCAFS SLC 40	1	False	False	False	NaN	1.0	0	B0007
3	4	500.000000	PO	VAFB SLC 4E	1	False	False	False	NaN	1.0	0	B1003
4	5	3170.000000	GTO	CCAFS SLC 40	1	False	False	False	NaN	1.0	0	B1004

## ✓ TASK 7: Create dummy variables to categorical columns

Use the function `get_dummies` and `features` dataframe to apply `OneHotEncoder` to the column `Orbits`, `LaunchSite`, `LandingPad`, and `Serial`. Assign the value to the variable `features_one_hot`, display the results using the method `head`. Your result dataframe must include all features including the encoded ones.

```

1 # HINT: Use get_dummies() function on the categorical columns
2 from sklearn.preprocessing import OneHotEncoder
3
4 # Apply OneHotEncoder to the categorical columns
5 categorical_columns = ['Orbit', 'LaunchSite', 'LandingPad', 'Serial']
6 features_one_hot = pd.get_dummies(features, columns=categorical_columns)
7
8 print("\nFeatures with dummy variables head:")
9 print(features_one_hot.head())

```

Features with dummy variables head:

	FlightNumber	PayloadMass	Flights	GridFins	Reused	Legs	Block	\
0	1	6104.959412	1	False	False	False	1.0	
1	2	525.000000	1	False	False	False	1.0	
2	3	677.000000	1	False	False	False	1.0	
3	4	500.000000	1	False	False	False	1.0	
4	5	3170.000000	1	False	False	False	1.0	

	ReusedCount	Orbit_ES-L1	Orbit_GEO	...	Serial_B1048	Serial_B1049	\
0	0	False	False	...	False	False	
1	0	False	False	...	False	False	
2	0	False	False	...	False	False	
3	0	False	False	...	False	False	
4	0	False	False	...	False	False	

	Serial_B1050	Serial_B1051	Serial_B1054	Serial_B1056	Serial_B1058	\
--	--------------	--------------	--------------	--------------	--------------	---
